

## Beaver Dams

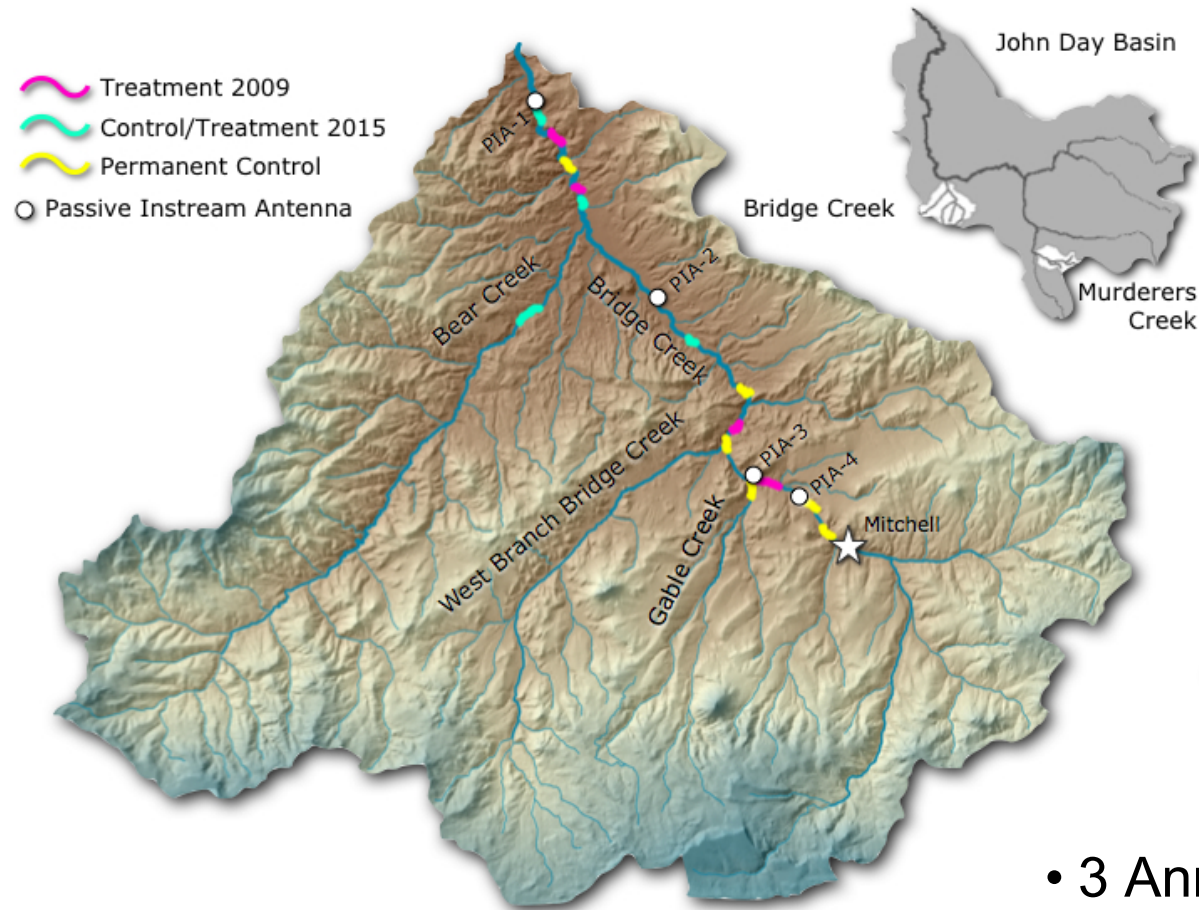

- 2008 = 22 (pre-BDAs)
- 2016 = 164!

# Bridge Creek Fish Population Monitoring

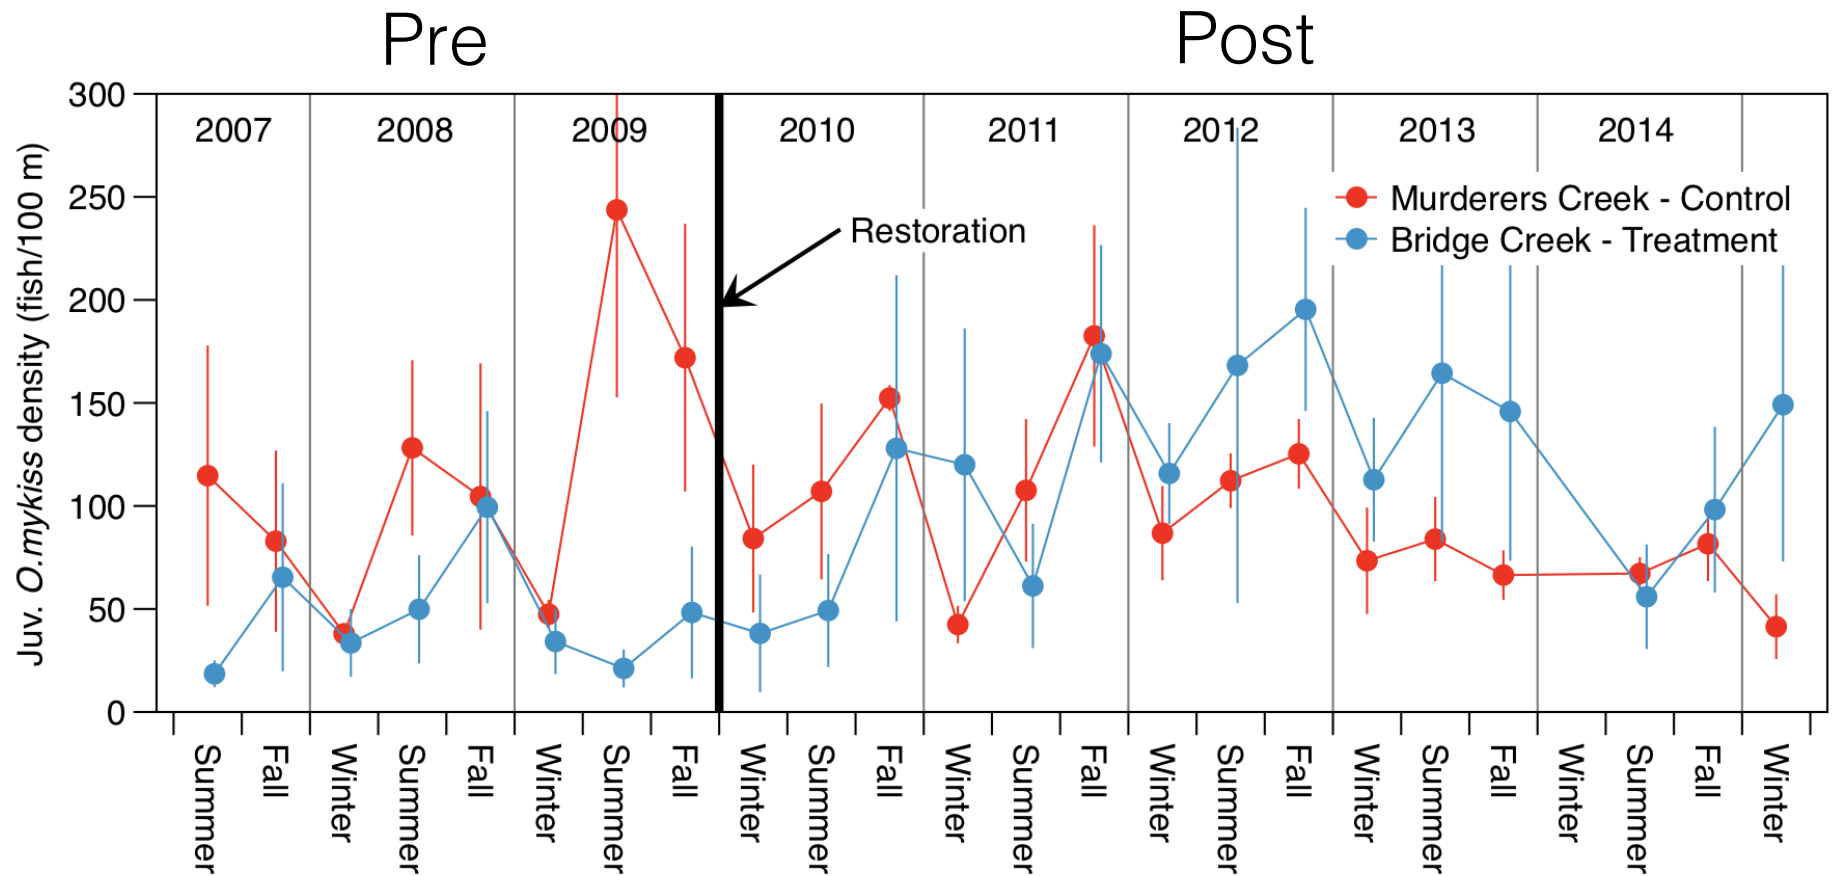

- 3 Annual M-R Surveys - 9 yrs
- ~ 50,000 Juveniles Pit-tagged
- 4 Passive Instream Antennas
- Adult Steelhead Trap

# Juvenile *O.mykiss* Density (fish/100 m)

# **Steelhead Response to increase in beaver dams and BDAs**

**168% increase in abundance**

**52% increase in survival**

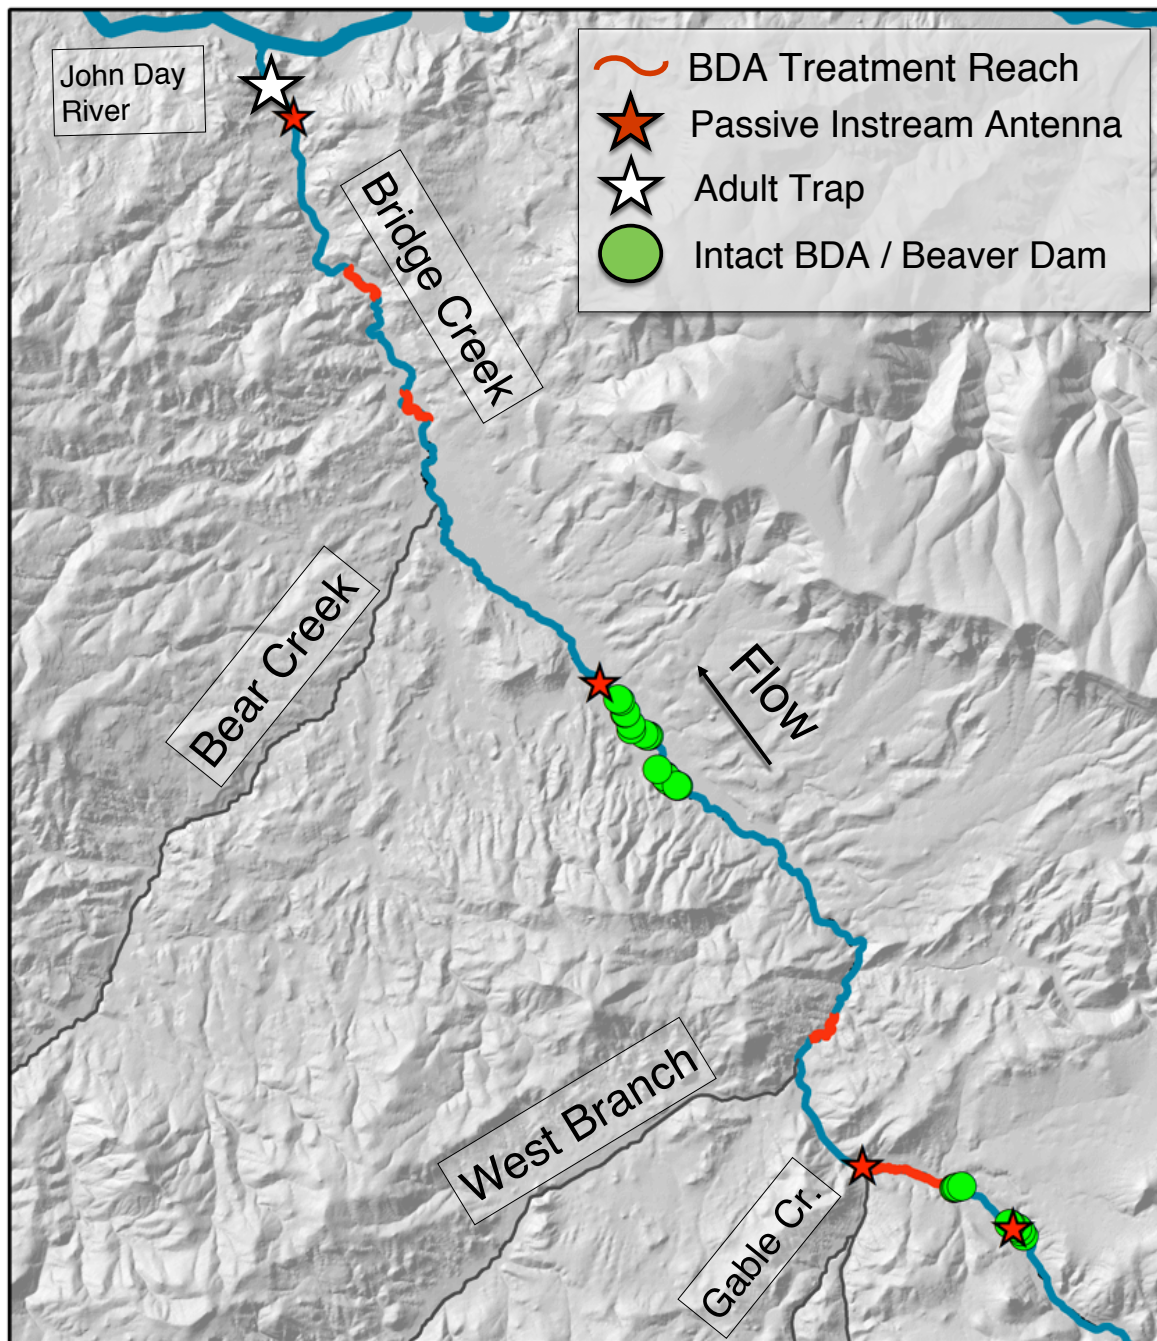

**172% increase in production**

Barriers??'

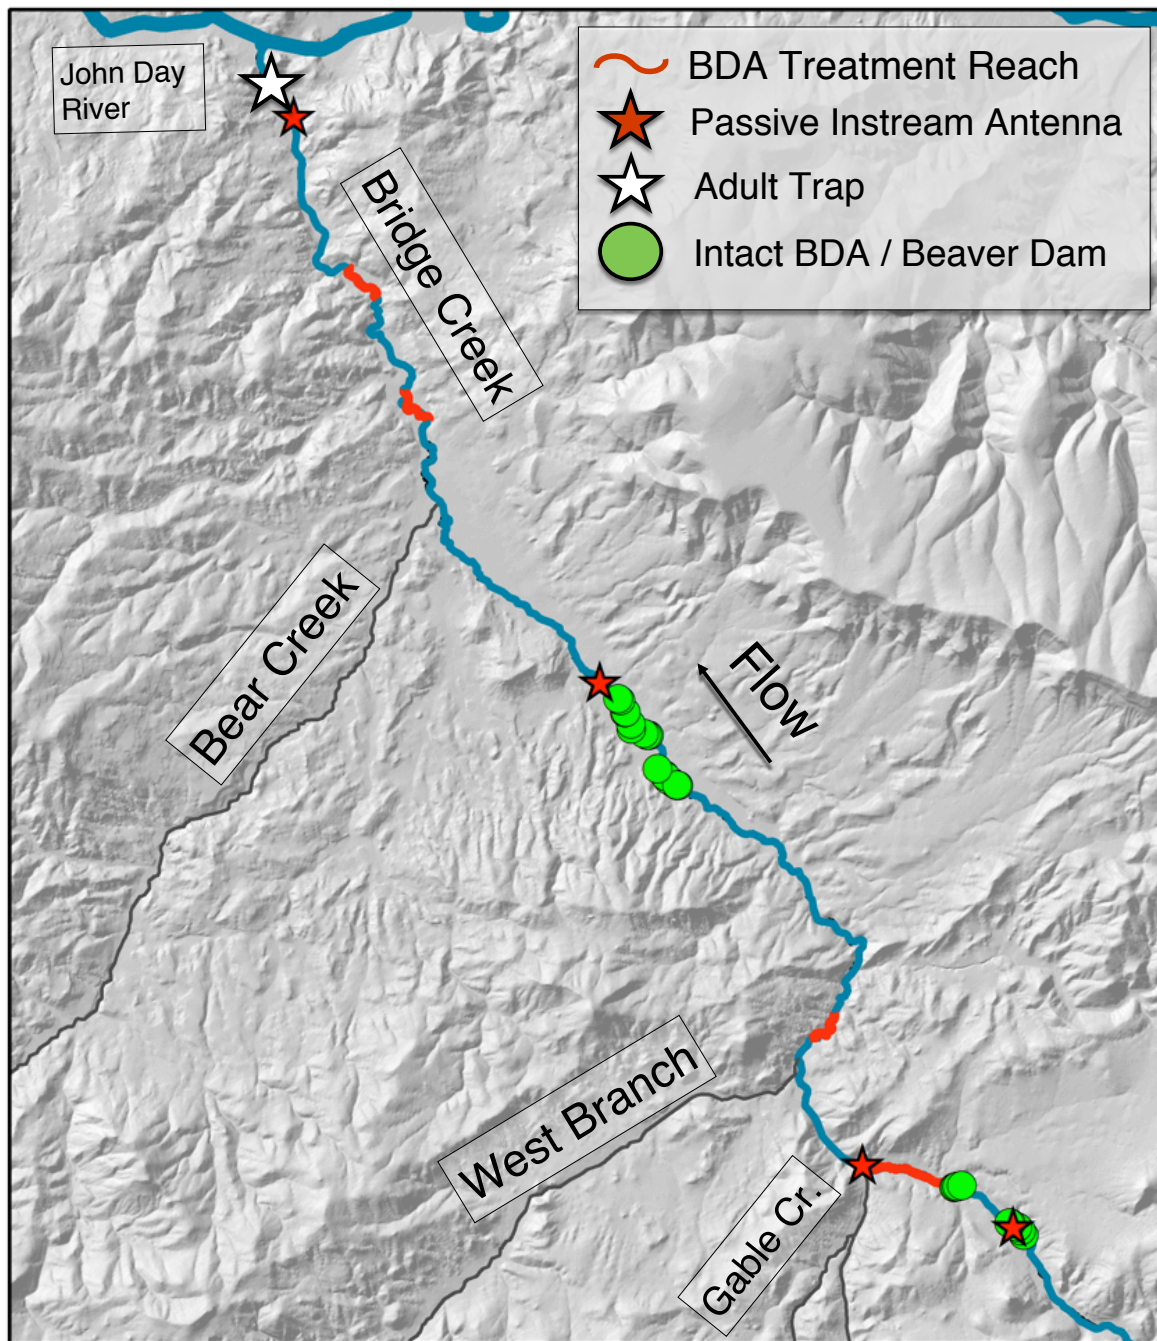

## Fish Passage

- 4 Instream Antennas
- Adult Steelhead Trap

 78,000 PIT-tagged *O. mykiss*

**2009**  
Pre-restoration

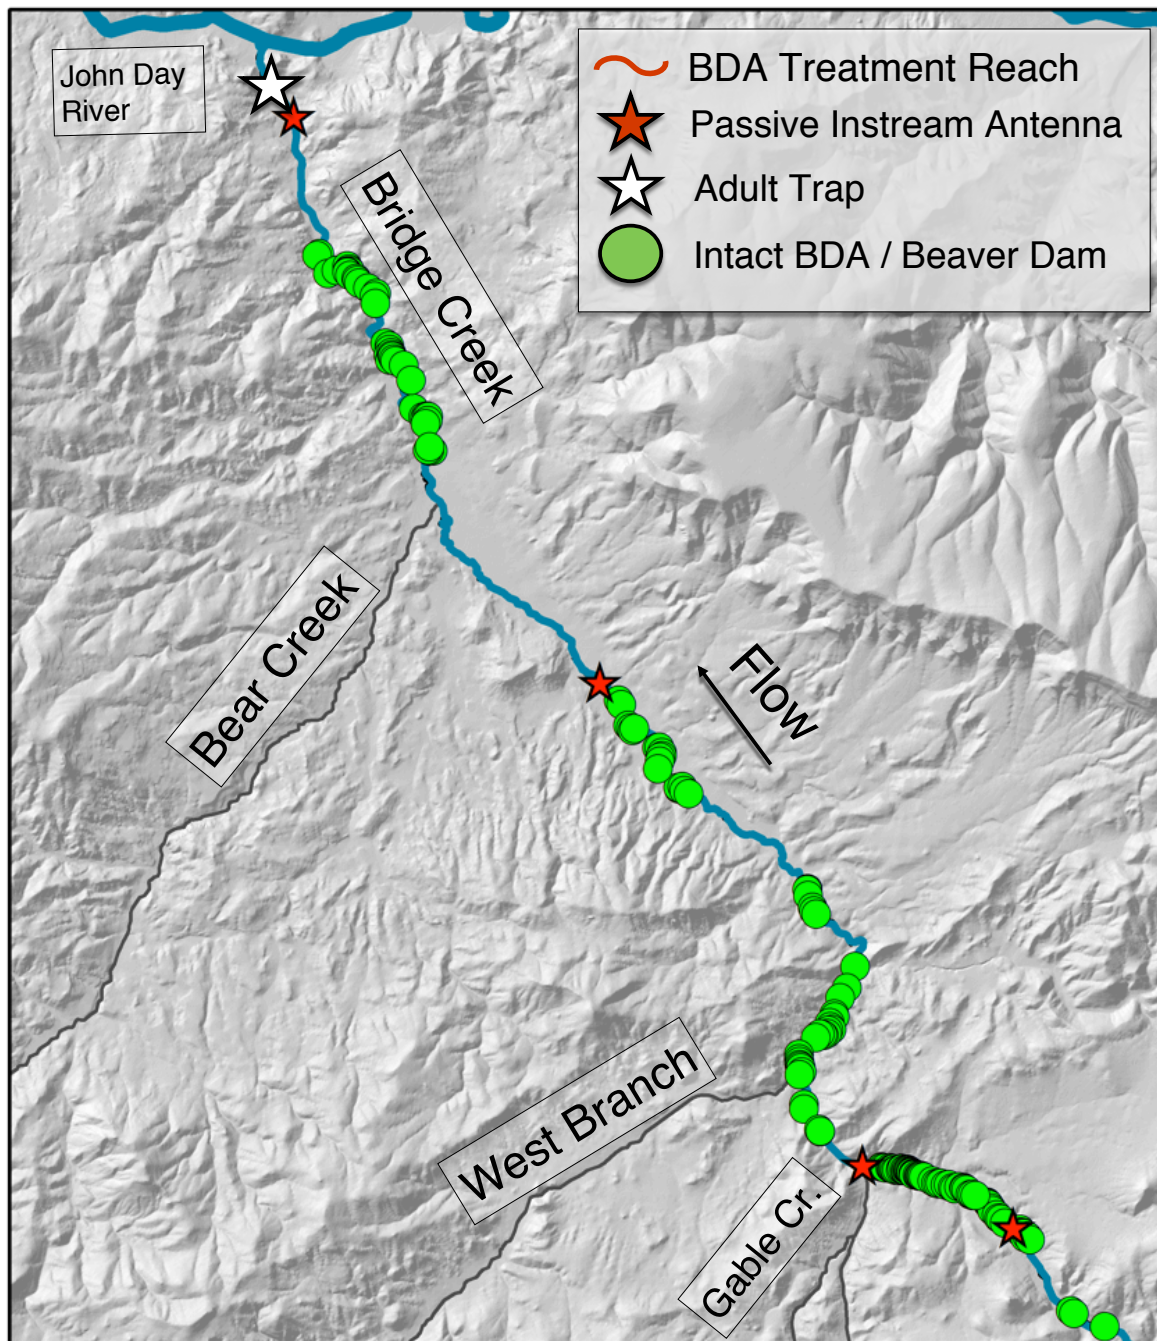

**22** Beaver Dams

**17%** Passage

**2016**  
Post-restoration

**164** Beaver Dams

**29%** Passage

# BDA Projects are Young

Long-term impacts unknown?

# Impairments treated by beavers

---

- Channel incision/disconnected floodplains
- Water storage
- Low flows (bump up surface water)
- Riparian expansion
- Habitat complexity for fish
- Habitat complexity for amphibians
- Habitat complexity for birds (e.g. sage grouse)
- Increase forage and water for cattle or wild ungulates
- Sediment storage
- Nutrient recycling

# Birch Creek, ID – Restoring Perennial Flow

---

## Restoration Goal

- Restore perennial flow

## Setting

- Abundant forage for beaver
- Shallow water depth – high risk of predation
- Previously unsuccessful beaver translocation

## Strategy

- Build BDAs to provide immediate habitat/refuge for beaver

## Birch Creek, ID – Restoring Perennial Flow

---

- Beaver utilized BDAs
- Successful translocation
- Continued beaver activity

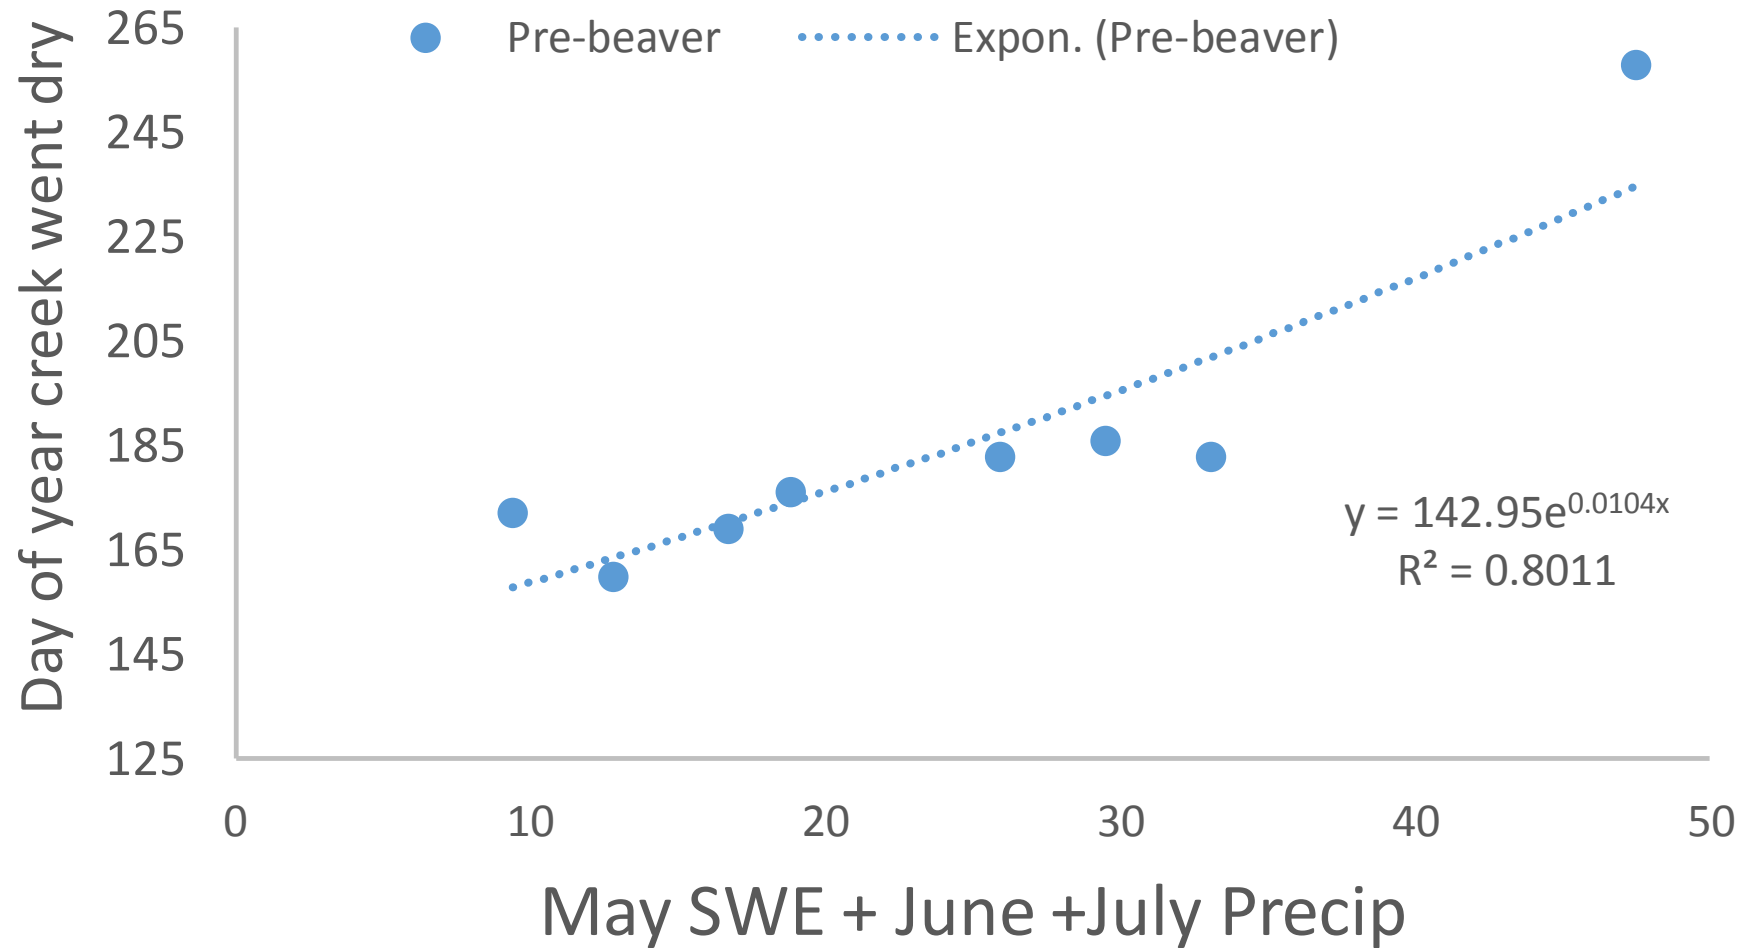

BDA flooded by natural  
beaver dam built downstream

## Tanner Family Improves Habitat For Cattle and Sage Grouse in Prime Habitat Area: NW Utah's Box Elder County

November 10, 2014

By Steve Stuebner ([Story PDF](#))

(Note: This story coincides

with the [Nov. 13-14 International Sage Grouse Symposium](#) in Salt Lake City)

The Tanner family's Della Ranch, they run about 1,000 head of Angus cattle on a mix of private and public lands in the heart of prime sage grouse habitat in Northwest Utah, due west of the Great Salt Lake. During the summer

# Leaving It To Beavers

With Their Extended Ranching History on Utah's Dry Rangelands, the Tanner Family is Returning to USU for Lively Expertise in Holding Water Longer

[Utah State University Magazine – Fall 2016](#)

# Maggie Creek

1980

2010

**Recovery is the result of grazing exclusion since about 1993 and colonization of the area by beaver.**

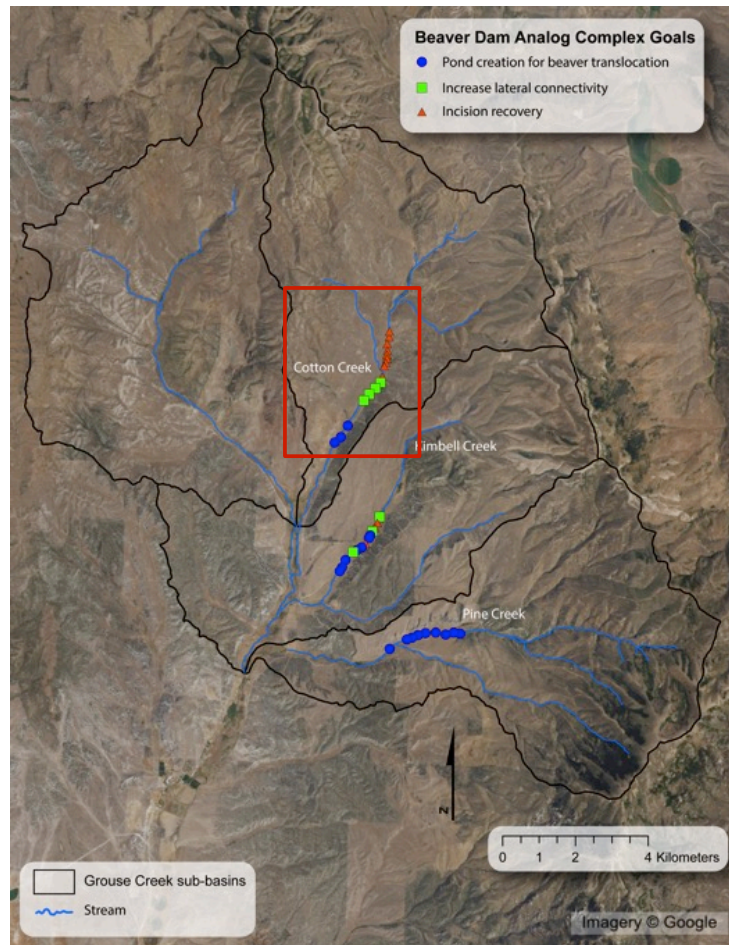

# Reading the landscape... expanding the emerald ribbon

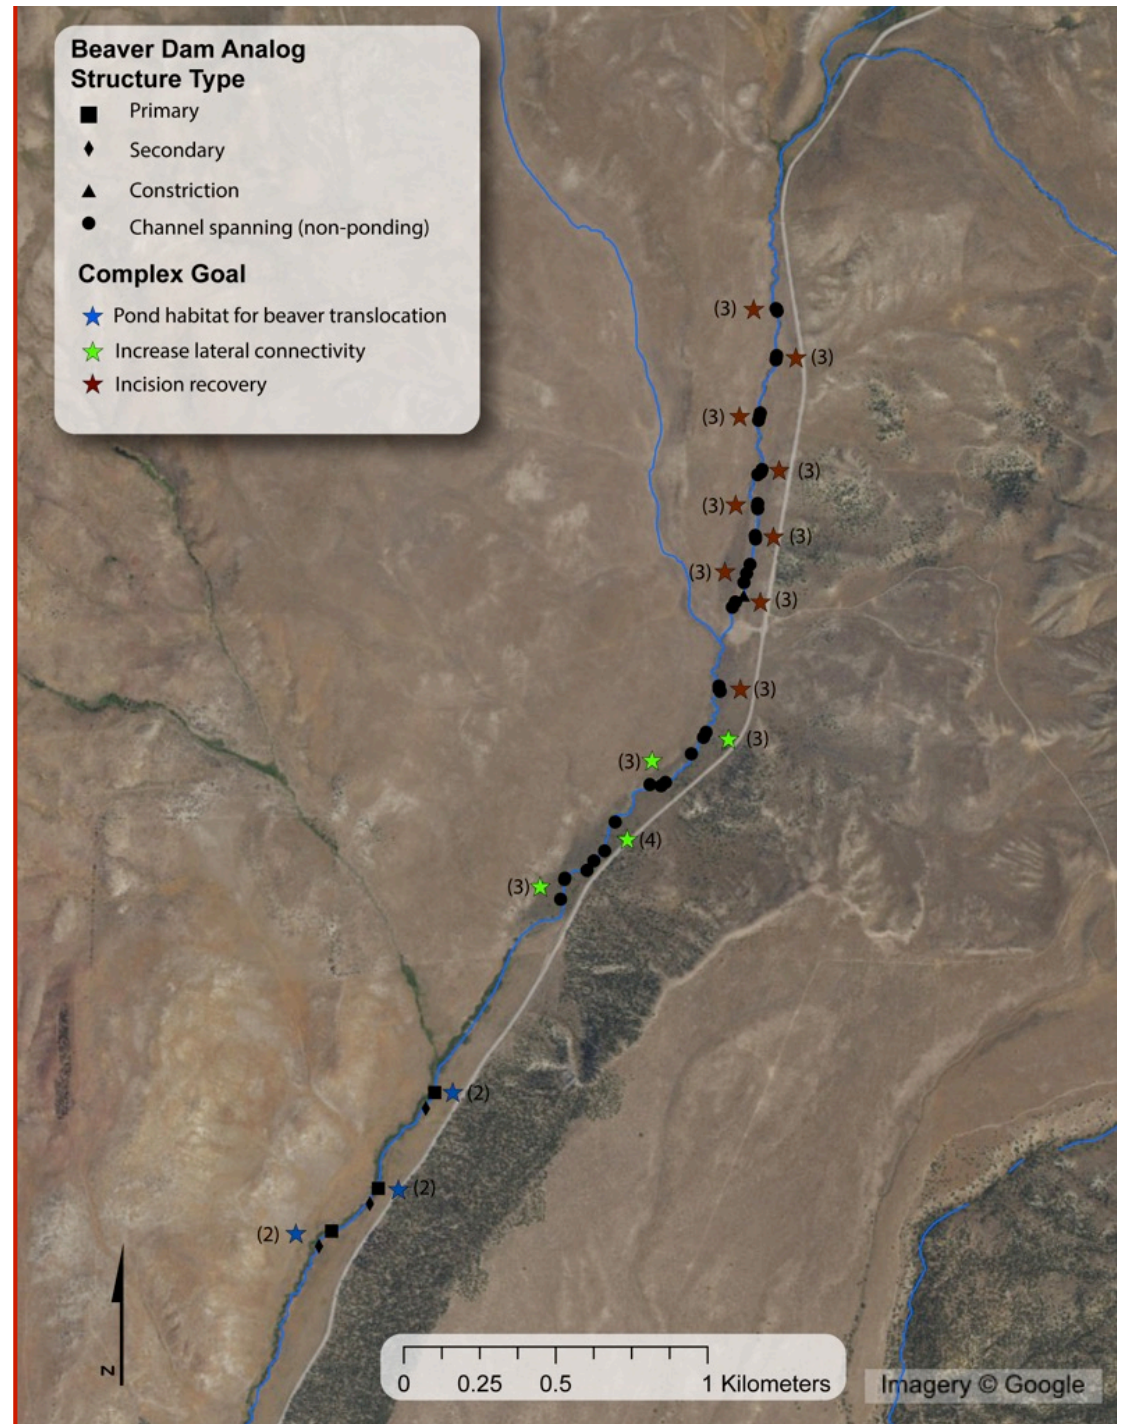

# BDA Treatments

Figures from Scott Shahverdian  
(Anabran Solutions, 2017)

## A pilot structure in high flow

No scientific results yet... just built pilots  
last fall (16 structures in 3 creeks) &  
implemented 114 structures this June

# San Rafael- Improving Fish Habitat

(Bluehead & Flannelmouth suckers, Roundtail chub)

# San Rafael- Improving Fish Habitat

Large-scale collaborative pilot

- Restore incised stream, floodplain connectivity - >
- What replaces the tamarisk?
- Increase habitat quality for endangered fish

# San Rafael- Improving Fish Habitat

- Breached dams provided most complex habitat
- Stable structures ≠ best habitat

# Fish And Wildlife Habitat

# Conclusions

- Small wadeable streams (where BDAs and beaver are appropriate restoration tool) make up the majority of the stream network.
- Many streams are degraded
- A lot of money spent on stream restoration
- Restoration needs to be relatively inexpensive, expansive and effective
- These approaches are flexible enough to address multiple watershed/habitat impairments

# Conclusions

- We need to demonstrate if and how restoration works - MONITORING!
- Leverage financial commitments to restoration and implement as a manipulative experiment- ADAPTIVE MANAGEMENT ! (Bouwes et al. 2016)
